About the project

After the promotional sales, JET Electros company wanted to know how the sale performed and how well the operation coped. Actionable insight was taken from the customer order database across six KPIs: demography, satisfaction, product importance, shipment mode, shipment promptness and warehouse usage.

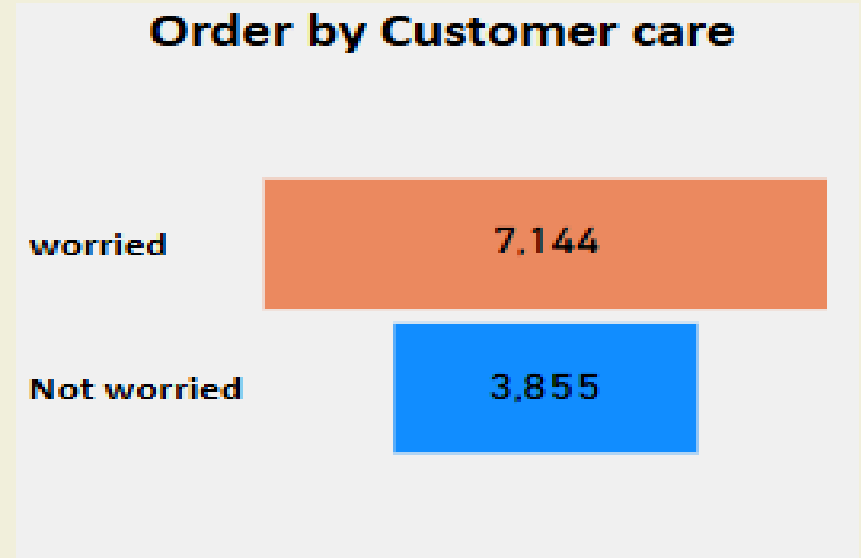

Overall discount was 6.4% which is about \$147.09K given away from \$2.31M of normal day revenue.

Customer demography

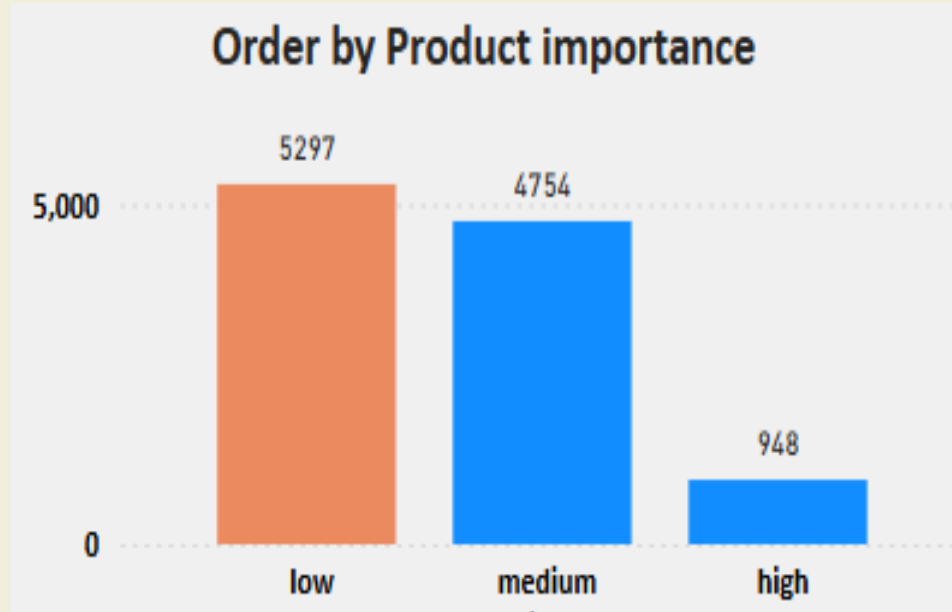

Both genders patronizes at the same order rate so gender does not separate customers.

Customer satisfaction

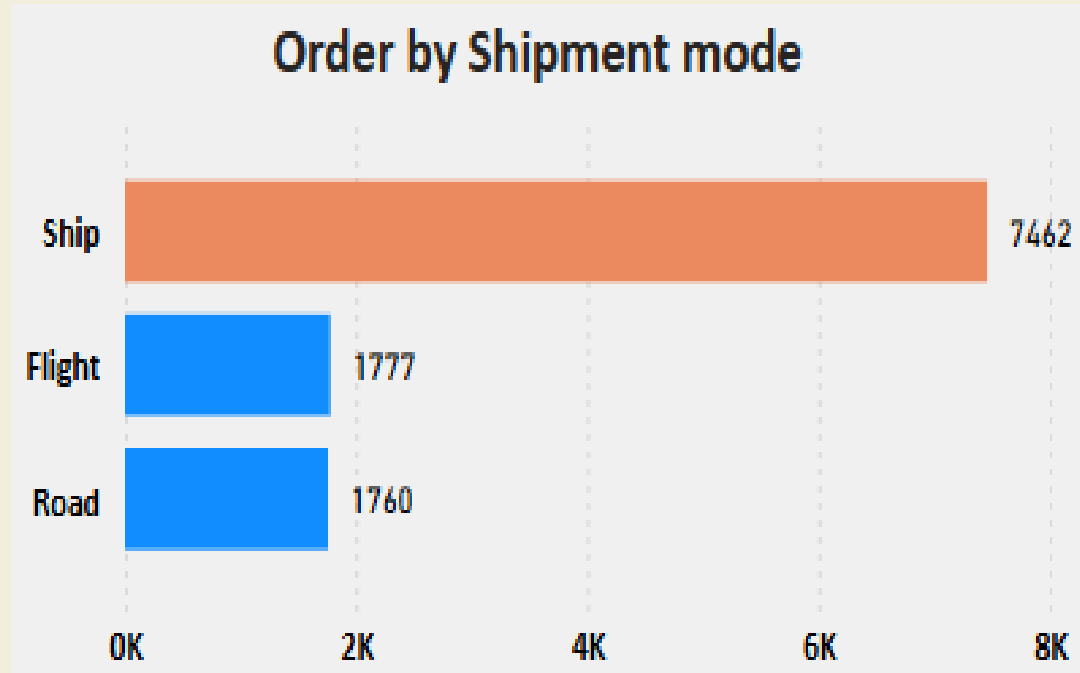

- The average rating is 2.99 out of 5 which is the fair category.
- Many customers were worried majorly because of the lateness in delivery.

Importance of products

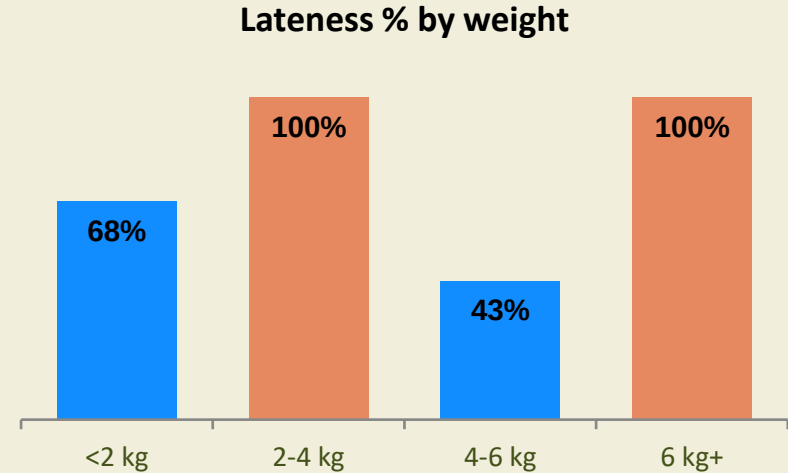

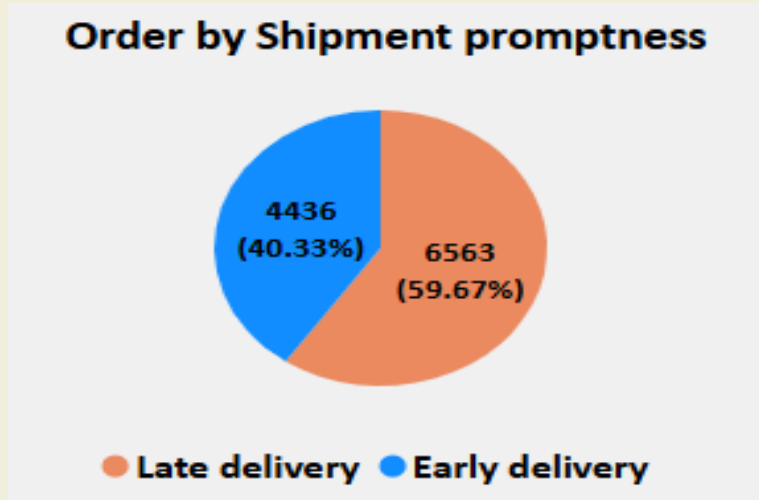

Customers order more of low and medium value during the sales.

Preferred mode of shipment

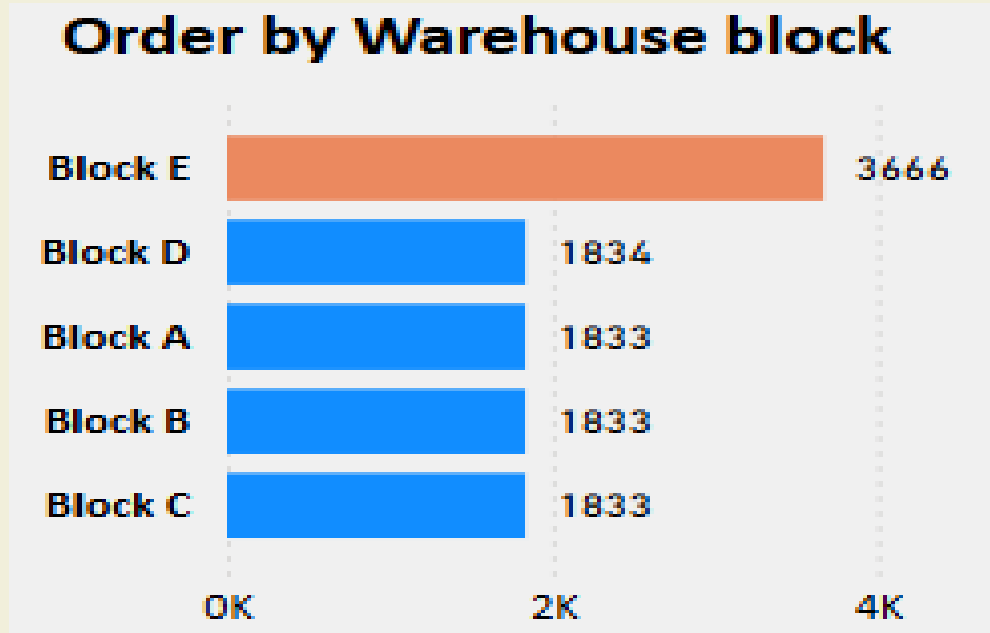

Ship carries most of the orders

Promptness of shipment

Higher percentage of the orders were delivered late, which is mostly the heavy ones which are transported by ships.

Warehouse blocks usage

Block E handles a lot of order (twice other blocks), it appears it has spare capacity compare to others.

CONCLUSION

- Reach back to customers that gave perfect and good rating to see if is possible to maintain them because we were able to get almost half of the sales revenue from them (\$860.10K).
- Rebalance orders from Block E to the other blocks to reduce bottleneck risk.
- Keep Ship as the default mode since faster modes add no measurable benefit, instead we should work on the delivery speed.
- Collect age and location data by prior purchases instead of gender.
